

ok so i have this base portal + admin right... i want a bit of a new feature. im gonna call this site volunteerclub. io. basically, it is a game where you grow your territory by volunteering. volunteering in an already claimed territory by your "club" will lead to that circle growing in size depending on how many hours are contributed. these circles can slowly merge through metaball-esque physics if they get close enough to one another, claiming more territory. volunteering in some other clubs territory creates overlap. on the student interface, make a completely scrollable map where you can view territories and everything, and have a sidebar leaderboard for top clubs by hours (daily, weekly, monthly, yearly). make the map monochrome to match the rest of the site aesthetic, and give each club its own unique color in the firebase. hovering over a territory should show you total hours achieved. also add a leaderboard on a per club basis so you can fight against your own friends :O. additionally, using real world data, mark places that are "high in need" for different categories like food, water, shelter, etc (should update daily using an api of sorts), and make it so that if you volunteer there, you contribute a few more bonus hours to your club overall (not individual). make it so that only approved hours count towards everything. if nobody has volunteered in a territory over time shrink its hours by a little bit (limited to 10 hours max shrunken so that progress and volunteering isnt seen as useless (maybe 1 hr per week of inactivity)). so on top of the student interface and admin interface, add an interface before it to join a new club (you can only join 1 club at a time), create a club, or view your club (which brings up the student / admin interface page). when configuring a club, allow the creator to add a password to make it private or they can keep it public (up to them). give them automatic admin through their email and allow them to kick people out in new admin ui page. Additionally, on that same page, make a place where organizations and people can "request service", where they can put the number of hours they will grant, a description of the service, location, contact info, and any other useful information. Make it so that users can view their requested service in a nice way. On the map, add a location marker indicating that someone requested service at that location with all of the information on a nice popup card. Have a "join" button, and make it so that the person who requested service can see everyone who joined, can kick people, and see all of their information (except personal ones like student IDs (add a section in admin where you can turn off student IDs btw and modify fields that show on the student end (rename it from student interface to volunteer interface) add it in a general settings in admin or something). Make it so that only the person who requested the service can grant the hours (approve the hours) from the interface, and can modify how many hours you get, (ensure that the admins can't approve these organization/person specific hours that were requested). Update the firebase logic to handle this new structure as well, get rid of all wylie naahs references and make it more general and customizable to club admins, and most importantly, keep the stylistic choices and make an impactful landing page and move the good auth to before all of these pages and not in the student / admin interface.
